

What is claimed is:

1. An electrical connector including a housing having a fitting opening for a mating connector, a flexible printed circuit board having electric contact elements capable of detachably fitting with the mating connector, a block embracing said flexible printed circuit board with said housing, bit inserts causing said block and said housing to be engaged with each other, and urging members for urging said flexible printed circuit board to a substrate, wherein said housing is provided with at least two positioning pins as positioning means with respect to said block, said positioning pins being able to be slightly press-fitted in insertion apertures of said flexible printed circuit board, and said block is provided with positioning apertures at locations corresponding to said positioning pins of said housing.

2. The electrical connector as set forth in claim 1, wherein said housing is provided with projections for urging said flexible printed circuit board against said substrate, said projections are formed with chamfered portions at contacting portions with said flexible printed circuit board for preventing it from being scratched.
